

# CYBER SECURITY: COMMON STRIKES HOW TO COUNTER

The purpose is to show you more commons hackers' strikes and to give you easy way to counter these.

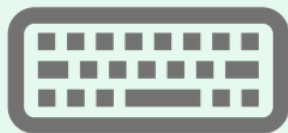

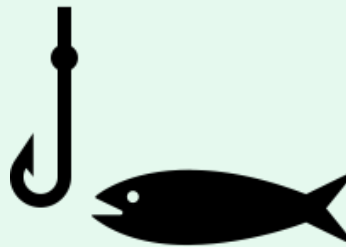

## Brute-force

Brute-force strike is about breaking password by trying a lot of possibility until you find the good one. To prevent it you should have a complexe password containing numbers, capital letters and special characters.

## Phishing

Hackers disguise themselves as a trustworthy entity in an electronic communication in order to obtain sensitive information as passwords, usernames or credit cards. To prevent it you should verify your contacts identity and links that they send to you.

## Key-logger

A Key-logger can have different forms like usb key or software. A keylogger catch all things you type on your machine so hackers can catch your password, usernames, etc...

## Malwares

Malwares are evil software which can slow your computer or even break it. To avoid it you should take care to your download and to the software that you install from the internet. You should install an anti-virus on your computer.

## Summary:

- Use a complex password.
- Verify your contacts identity.
- Verify link that you receive thought the Internet.
- Protect your computer (anti-virus).
